• Notes: If the WiFi hotspot detail window 'detected a WiFi hotspot of the same name', please delete the outdated WiFi hotspot details. • Notes: If the WiFi hotspot detail window 'did not detect a WiFi hotspot of the same name', please reinstall the device driver if you are using Windows 8 or Windows 10. WiFi Hotspot Scanner Screenshots: patients who were referred to the clinic. To confirm the compliance of the study population, the clinic attendance rate was determined. The attendance rate of the subjects was 78.24% (101/129), which was slightly lower than the average rate of 85% \[[@ref27]\]. According to study by El Asri et al \[[@ref15]\], the attendance rate of genitourinary disease was 80.5% while the attendance rate of respiratory disease was 66.5%. The factors affecting the study population to attend the healthcare center included male gender, the presence of related chronic disease, and having no private health insurance. These findings were similar to the findings of other previous studies \[[@ref28]-[@ref31]\]. Female patients mostly have less access to health care centers \[[@ref32]\]. This might be attributed to the fact that the female patients may prefer not to visit a health care center for medical treatment \[[@ref33]\]. Also, this study showed that the pre-transitional and the formal education levels were the predicting factors of healthcare utilization. The factors affecting healthcare utilization of the study population were reported as education level, occupation, smoking, physical activity, husband's occupation, breast feeding, family income, and marital status. These factors were similar to the findings of other

studies conducted in different parts of the world \[\[@ref33]-[\@ref41]\]. However, the incidence of chronic diseases in Turkey was found to be lower in this study compared with other developed countries \[\[@ref42]\].

Conclusion {#sec1-5} ===== The study population was weakly educated. They were mostly covered by social security program. It was determined that pre-transitional and formal education levels were the predicting factors of healthcare utilization. Further studies should be conducted on the other factors affecting healthcare utilization and more strategic and effective interventions should be performed. ****Conflict of Interest:****The authors declare no conflict of interest. ****Financial Disclosure**
